MAKING *the* MOST *of* COMPTON'S PICTURED ENCYCLOPEDIA

A Library of Good Reading

AN ENCYCLOPEDIA prepared, as this one has been, with a new vision and a new purpose is capable of serving in many widely different and many unexpected ways. The extent of this service does not, however, depend solely upon the quality and scope of the work accomplished by the editors and publishers. It depends also upon you—upon the intelligence with which you use the instruments that have been placed in your hands. It will be profitable therefore to examine briefly the nature of these instruments, and to determine how they may be made to yield the maximum service.

The main text and the illustrations need little explanation. The articles are arranged, of course, in alphabetical order, and the alphabetical guide words are printed in the top corners of each page. The longest and most important articles begin in nearly every case with special headings extending across both columns. These headings are designed to catch the eye and to set forth at a glance the spirit and significance of the subject. The illustrations will always be found directly associated with the articles they illustrate. Too much emphasis cannot be placed upon the importance of reading closely the text which accompanies and explains the pictures. This text, with a few necessary exceptions, *does not repeat* information already given in the article, but consists of *additional information* of the utmost value.

A Key to Systematic Study

The chief distinguishing feature of Compton's Pictured Encyclopedia is the fact that its articles are written in a style so vivid and interesting that they may be enjoyed as you would enjoy the stories in a magazine. In keeping with the purpose to make the encyclopedia a library of "good reading" as well as a work of reference, lists of the most important articles will be found at the beginning of each volume under the title "Here and There." Make use of those lists when you pick up the volumes for casual reading; they will help you to select the "fact-story" suited to your inclination of the moment.

As you thumb through the pages of the main text, you will notice that there are comparatively few of the so-called "definition" articles, such articles as undertake in four or five lines to define subjects considered relatively unimportant. You will notice also that there are none at all of the so-called "dummy entries," in which the name of the subject appears merely to direct you to some other article where it is treated, as for instance: "ANTHROPOMETRY. *See* Anthropology." These devices, so common in the older works of reference, not only consumed an enormous amount of space, but proved unsatisfactory to the reader. The "definition" articles rarely contained an adequate amount of information, and what they did have usually had to be repeated elsewhere in connection with some larger related subject. Thus a subject like "Combustion" would be briefly defined under that name, then necessarily referred to again under "Fire." The "dummy" entries, on the other hand, contributed absolutely no information and resulted in annoyance and loss of time to the student or reader.

An Inexhaustible Mine of Facts

The Value of Combined Information

Compton's Pictured Encyclopedia abandoned at the outset this ancient system. The result has been twofold: first, so much space was saved by doing away with duplication that the editors were able to include vastly more information in the compass of the work than would appear possible, judging by former standards; second, and even more important, the minor subjects were put *where they belong*—that is, they were incorporated in those larger subjects of which they form a part, and which provide the background necessary to bring out their meaning and relative importance. Thus, no separate article is devoted to the process of "Osmosis." A mere abstract explanation of this term might consume more than a column, and still leave the reader somewhat in doubt as to its true meaning and importance. But in the article on "Plant Life," the process of Osmosis is not only defined and described, but its vital significance in Nature is brought out by picture and text in a manner to attract interest and make a lasting impression. In this way the "Plant Life"

A Universal Picture Gallery

article helps to make Osmosis clear and Osmosis in turn contributes to the understanding of one of the most important features of Plant Life.

The "definition" articles and "dummy entries" were essential to the old type of American encyclopedias, *because they did not have adequate indexing systems.* If a reader was to find a subject at all, the name, at least, had to be included in its alphabetical place in the text, even if the proper treatment of that subject was given elsewhere. Obviously, no encyclopedia, no matter how large, can list in its main text all the subjects and names which a reader might seek. You would, for instance, look in vain through most encyclopedias, even the largest, for an entry on "Nancy Hanks," and unless the encyclopedia carried an index you might never find out that this was the maiden name of Abraham Lincoln's mother. Latin names of plants and animals are constantly occurring in scientific texts without their English equivalents, yet many of the very commonest ones, such as *Musca domestica* (the housefly) could not be found in the largest encyclopedias without an index.

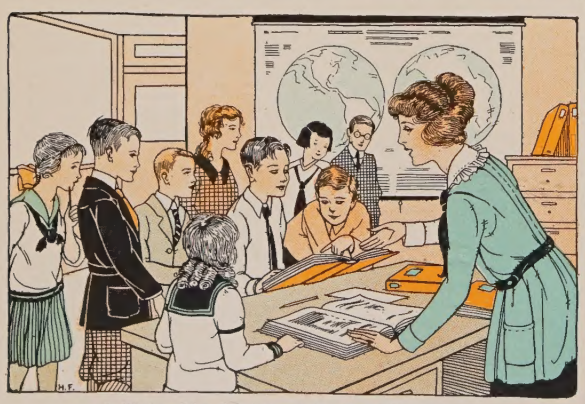
The Value of the Fact-Index

The editors of Compton's Pictured Encyclopedia saw from the outset that an adequate index would not only permit them to save space and gain interest and emphasis by a suitable combination of related subjects into longer articles, but also that it would make readily accessible to the reader every detail of information in the whole work, whether in the text or in the pictures. By close study and tests they determined that casual references could in the long run be found much more quickly by using an index than by searching through the text. They went further than this—they decided to give the index somewhat the character of a dictionary in which would be provided brief definitions of unusual words and their pronunciation, short biographical summaries, condensed geographical information, résumés of the chief events in the history of important countries, and countless other informative details—all in the interest of saving time and trouble.

A Guide to the Best Books

The result is the Fact-Index at the end of the encyclopedia. This marks an important step forward in the preparation of reference works. No enterprise of such scope, of such variety of usefulness, of such completeness has ever before been carried out in connection with an encyclopedia. With its aid you are able to extract the full value from every word of the text.

The moral of this lesson is obvious: ALWAYS USE THE FACT-INDEX WHEN YOU ARE LOOKING FOR A DEFINITE REFERENCE. If you want to know quickly what are the native races of Africa, do not read through the whole article on Africa, but turn to "Africa" in the Fact-Index, and there you will find the subdivision "native races," with page numbers telling you exactly where the information is to be found. Even if you are interested in Africa as a whole it is better to go to the Fact-Index, for it will give you many page references to information in other articles *outside* of the Africa article. By this means, if you wish, you can read all there is about Africa in the whole encyclopedia.



A Valuable Assistant in the Classroom

Become familiar with the technical details of the Fact-Index, with the simple abbreviations used in it, with the system of subdividing the larger entries for the reader's convenience. All of it is very clear and easily understood, and the more you use it, the more it will yield you. Once you form the "index habit," you will be surprised how easily you can run down information. It is an old and true saying that "half of all education lies in knowing *how to use* good books."

Other Aids to Readers

The Study Outlines form another great aid to the users of Compton's, providing a broad review of all the great branches of knowledge. With them are included Guides to Good Books, Picture Lists, and Interest-Questions. A description and itemized list of all of these valuable features will be found on pages 3843–45. Call them constantly to your service. For every investment of time and energy you make in this way, you will be repaid tenfold.

Editor's Note

EVERY user of a Compton's Pictured Encyclopedia should form the habit of *first* turning to the Fact-Index when in search of specific information. This is a miniature work of reference in itself, presenting the essential facts about a large proportion of the entries which it contains. When additional information is presented in the preceding volumes, the page numbers (in **black-face** type) show the reader where to turn.

The first reference in every case where page numbers are given is to the most important place of treatment, with other general references following. Thus, under the entry **"Appalachian Mts.,"** the first reference is to the article bearing that heading in Volume I, followed by a reference to the article "United States," and then by a reference to the section of the Study Outlines which enumerates the various divisions of the Appalachians. Then follow various scattered references, arranged alphabetically under appropriate subheadings, such as "effect on climate," "geological history," "minerals," etc.

The arrangement of subheadings is always alphabetical, except in the case of most major historical and biographical entries. In these the chronological order is followed.

Pictures have not been indexed where they appear on the same pages with text references, except for purposes of special emphasis or to prevent confusion. The word *picture* in an entry does not necessarily mean a picture of the subject of the entry; often it rather calls attention to the matter contained in the accompanying picture-text. For example, under the heading **"Rawlinson"** there is a brief sketch of the man, with a reference to the picture of the Behistun Rock on page 2739, under which appears a description of how Sir Henry Rawlinson discovered this rock and deciphered the inscriptions on it.

The pronunciations given are those preferred by the best and most recent authorities; alternative pronunciations are indicated only where usage is equally divided. For foreign names the native pronunciation is given except where the English pronunciation has become thoroughly established, as in "Paris," "Barcelona," "Seine."

Populations are given in round numbers, except for places in the United States, where the figures are those of the 1920 census. Distances between points are map distances, not distances by railroad.

The EASY REFERENCE FACT-INDEX

A

YOU know, of course, that members of the bird family—notably the goose—helped teach men to write, by furnishing them with quills, but did you know that some of the bird people helped make the very letters that were afterward written with their quills? The owl, for example, with his horns and his beak, gave us our M. The letter Z was originally a duck, a duck of ancient Egypt that, in its formalized shape, now waddles along at the end of the alphabet, while the lordly eagle leads the procession as the A. In Egyptian picture writing the eagle first had its proper shape, like this: Then as it came to be made by the Egyptian scribe in writing a running hand, it was simplified to this: When the letter in this second form passed over into the Phoenician alphabet and was used in stone inscriptions, it was easier to carve by using straight strokes of the chisel, and it was made like this: After the Greeks got it from the Phoenicians and put it into their alphabet, they gradually straightened it up to a horizontal position, thus: making the letter as we have it today. Besides being so useful in telling other people's stories in books, you see the letters have interesting stories of their own. You will find one of these stories at the beginning of each Letter Section in this Fact-Index.

B

OUR letter B seems to have started its long career in the shape of a crane, in ancient Egyptian picture writing. Presently the Egyptian scribes gave it a simpler form, which resembled the outline of a tent. So when the Phoenicians and Hebrews took the symbol over into their alphabets, they named it *Beth*, which means "house." The Phoenician form of the letter resembled a tent supported by its pole, but some of these early B's or Beths, it seems, were more aristocratic in their habits than the tent Beths, for Dr. Isaac Taylor—whose story of the alphabet makes two nice fat volumes—says: "Other forms suggest that it represented the plan of a two-chambered eastern house (notice that our big B has two rooms) with the men's apartment on one side and the women's on the other." In sound, B is closely related to *p*, *f*, *v*, and *m*. Just say them over now and see. If you are studying Latin, you will appreciate one of Martial's little jokes on the Spaniards of his day, who pronounced *b* as *v* and *v* as *b*. He said of them that *vivere* (to live) is *bibere* (to drink). This was true in two senses, for the ancient Spaniards not only mixed their *b*'s and *v*'s, but they were heavy drinkers.

C

WE might call C a royal letter, not only because it stands for the word "crown" in English, but because in the hieroglyphic writing of ancient Egypt it was a throne In its simplified form it looked more like a camel with its hump The Phoenicians and Hebrews called it *Gimel*, which was their word for "camel," and wrote it Among the Greeks this same *Gimel* became *Gamma;* a little Greek said his A B C's like this: *Alpha, Beta, Gamma.* By this time the camel had turned around and the hump had become a right angle, so that it looked like this Then gradually it became transformed into the round.ng letter C. Its sound was a hard *g* (as in "go"), but the Romans afterwards gave it the sound of *k*. In Anglo-Saxon or Old English, *c* had the sound of *k*, but it was gradually changed to *ch* before *e* and *i*. In the English of today, it still has the sound of *k* before *a, o, u,* and before any consonant other than *h*. Before *e, i,* or *y* we give it the *s* or *sh* sound. As a matter of fact C isn't really needed in the alphabet nowadays, since all its various sounds can be represented by other letters, but nevertheless it is still one of the most popular of the letters, as you may see from the number of pages in this section of the Fact-Index.

D

IN Egyptian picture-writing the symbol corresponding to our letter D was a hand When it became conventionalized, it looked like this and later among the Phoenicians became a triangle with a short tail the tail in time being dropped. The Phoenicians called it *Daleth*, which means "door." If you fail to see the resemblance between the form of this letter and that of a door, remember the primitive house was a tent and the door simply a triangular curtain hung in front of the opening. The name and form of this letter were adopted by the Greeks with slight variation, and thus *Daleth* became *Delta* Δ You remember you learned in your Geography that the delta of a river gets its name from its resemblance to the Greek letter *Delta*. For a long time its form did not change greatly, but it showed a tendency to turn over and over like an acrobat. Thus in one form we find it standing on its head, and in another the apex is turned to the right. When the sides which met at the right were written or engraved at one stroke, it became the D with the rounded back which was adopted by the Romans and which we use today. In sound *d* is classed with *t* as a dental. Its sound is produced by placing the tip of the tongue against the sockets of the teeth, while the vocal cords are vibrating. Without the vibration *d* becomes *t*. It is therefore called a "voiced" dental, while *t* is an "unvoiced" dental.

E

CAN you find a sentence in this encyclopedia in which the letter E does not occur? Of all the letters in the English alphabet E is the one most used. We should not know how to get along without it. And yet the Egyptians and the Phoenicians didn't have it in their alphabets. Its ancestor, however, was the Egyptian which was simply the sign of a breathing. When later it was written it looked like our E turned down. The Phoenicians called it *He* (pronounced *hā*), meaning "window," which seems a pretty good name for a breathing sound, although it is rather hard to see its resemblance to a window in form. The Phoenicians and Hebrews changed the form of it still further, turning the stem up. But they wrote from right to left and so they faced it toward the left like this The Greeks, who wrote from left to right just as we do, turned it around. They were the first to use it as a vowel. In English we give the name of the letter the long "ee" sound. But in the other languages using the Roman alphabet its name is pronounced "ay," which is its original long sound. The *e* sound does not occur in English as frequently as the letter, for in a great many words the letter is silent, being used often to lengthen a preceding vowel (compare, for example, *at* and *ate*, *bit* and *bite*); and sometimes it is used without serving any purpose of pronunciation, as in *gone*, *live*, *give*.

F

THE letter F looks so much like E that some have thought it developed from the same form, but such is not the case. It has its own interesting story to tell. Long ago it was the Egyptian cerastes or horned asp. The two bars are survivals of the two horns of this poisonous viper, while the vertical stroke represents the body. Written in a running hand it became and then the Phoenician which they called *Wau* or *Vau*, meaning a "hook" or "peg." The Greeks wrote it much like our Y and called it *Digamma* from its fancied resemblance to two united gammas or G's, one above the other. We fail to find it in the modern Greek alphabet, for after a time it dropped out of general use. The western Greeks continued to use it for some time, however, and the Romans adopted it from them, giving it the form which we now use, as well as its sound "ef." Its original sound, as you might guess from its Phoenician name, was that of our *w* or *v*. And it was sounded as *w* even by the Greeks. The *f* sound in English is often represented by the digraph *ph*, as in "philosophy." This *ph* represents the Greek letter *Phi* which, we are told, was originally pronounced *p-h*, like the final sound of "lip" in English, but in time came to be equivalent to Latin *f*.

G

OUR capital G is made from the Latin C, which as we have learned is a rounded form of the Greek *Gamma*. Until the middle of the 3d century B.C. the letter C was used in Latin inscriptions to denote both the *c* and *g* sounds, and throughout the whole of Roman history C remained as the symbol for G in the abbreviations C. and Cn. for "Gaius" and "Gnaeus." But on account of the inconvenience of not being able to distinguish between the two sounds of the character C, a slight modification was made for the *g* sound. The new letter G occurs in a famous epitaph on Scipio Barbatus, who was consul in 298 B.C. The monument on which his epitaph appears is one of the treasures of the Vatican. Plutarch says that the new symbol was invented by Spurius Carvilius Ruga, who spelled his family name R V G A instead of R V C A (the V still being used on stone inscriptions and wax tablets for the sound which we represent by U). At first the capital G was so much like C that you could hardly tell the difference, the lower lip of the crescent merely rising up in a straight line. In a later form this was curved inward, and in another form it had a sort of "goatee" added, which in time became the little cross-bar of the G we know. In modern English G has two chief sounds: "hard," as in *go, gave, glad,* and "soft," as in *gem, gentle, age.*

H

HAVEN'T you often wondered why so many uneducated English people are constantly leaving off "h's" and putting them where they don't belong? As when the cook says, "I'll 'eat it first, ma'am, and then you can heat it." You may be interested to learn that even the ancients dropped their "h's," and that the modern sound of the letter is a weakened form of the older and stronger Phoenician *Cheth*, which was pronounced about like Scotch or German *ch*. This Phoenician letter consisted of two uprights connected by two or three transverse bars and its name meant "fence." It was derived from the Egyptian hieroglyph representing a sieve which developed into the form and finally was transformed into the angular ladder-like character. The early Greeks wrote it and later, omitting the cross bars at top and bottom, gave it the form of our H. Its sound also ceased to be a harsh guttural and became an aspirate or breathing sound like our *h*. Soon, however, the eastern Greeks lost the aspirate and, having no further use for the symbol with this value, adopted it to represent the long *e*-sound (like our *a*), calling it *Eta* instead of *Heta*, as formerly. The western Greeks, however, retained the aspirate for a longer time, and the Romans took it over from them. The Roman *h* was, however, a very weak sound and in vulgar Latin soon disappeared. This explains why the *h*-sound is virtually non-existent in French, Italian, and Spanish, which are derived from the Latin. Perhaps one reason why the Englishman has so much trouble with his "h's" is that during the period when the English language was taking shape, it was the rule to pronounce the letter in words derived from the Anglo-Saxon and to treat it as silent in words of Latin origin. This naturally caused great confusion. In a few English words of Latin origin, as *heir*, *hour*, *honor*, *h* is still, as in French, written but not pronounced.

I

THE ninth letter of the alphabet is one of the simplest of the letters in form, but it was not always so. Among the Egyptians it was represented by two parallel lines 𓏲 and the scribes wrote it like this 𓏺 The Phoenicians gave it the form 𐤉 and called it *Yod*. As written by the Hebrews (י) *Yod* was such a little insignificant letter that its name came to be used for the smallest part, the least bit of anything (our word "jot"). Thus Christ is quoted as saying, "Till heaven and earth pass, one jot or one tittle shall in no wise pass from the law, till all be fulfilled" (Matthew v, 18). The Greek word for the letter I (*Iota*) is used in the same way. Among the Greeks *Iota* was first written as a zigzag mark resembling a thunderbolt, but it finally straightened up into the upright I, which the Romans adopted. The old letter *Yod* had originally been a consonant with a sound like that of our *y*. In Latin it was used sometimes as a vowel and sometimes as a consonant. As a vowel, its name and its long sound originally rhymed with "bee," and it was not until the end of the 16th century that its long sound in English became *ai*. The "i" sounds (long and short) are the most frequent of all vowel sounds in English, though the letter E occurs more frequently.

J

LIKE C and G, and U and V, the letters I and J were originally forms of the same letter. The vowel sound *i* and the consonant sound *j* were both represented by I until about the 15th century. Then some of the monks who worked on the beautiful illuminated manuscripts of that time used to lengthen the letter I and curve it toward the left when it began a word, thus making of it an ornamental initial. Gradually this form came to be used entirely to represent the consonant sound while the old form was retained for the vowel sound. This consonant sound which, as we have already learned, was like our *y*, came to be *dzh*, like our soft *g*. In German and some other languages, however, it is still pronounced *y*.

K

YOU would scarcely guess that our letter K was once the Egyptian hieroglyph which was the picture of a bowl. But when written it looked like this and its modified form in the Phoenician alphabet begins to look somewhat like our K, written backward. The Phoenicians called it *Kaph*, which means the "palm of the hand," or perhaps the "bent hand." The Greeks in transferring *Kaph* to their alphabet gave it its present form and changed the name to *Kappa*. In Latin after C had come to be used for the *k* sound, there was no need of K and it fell into disuse except in certain abbreviations. Anglo-Saxon and early English, under Latin influence, likewise used C for the *k* sound, until the practice of giving C the *s* or *sh* sound before certain vowels (as in *century, cinder, ocean*) led to confusion. Then K came to be used, particularly before e and i, for the hard sound, as in *kind, keg*, etc. The combination *ck* so common in modern English following a short vowel was originally *kk*.

L

THE letter L is thought to be descended from the ancient Egyptian hieroglyph representing a lioness which became the symbol or when written in a running hand. Here we can already see some resemblance to our letter. The Phoenicians wrote it like this and called it *Lamed*, "ox-goad," from its resemblance to that object. The Greeks called it *Lambda* and turned it about so that it looked like our V upside down The Romans straightened it out to the form we have today. The letters L and R, known as the liquids, are very closely related. In fact scholars tell us that in Egyptian, as in some other languages, no clear distinction was made between them, the signs for these letters being used interchangeably. There are peoples, the Chinese for example, who cannot sound the *r*, and these substitute *l* for *r*, as when they say *Melican* for *American*. This use of *l* for *r* is known as "lambdacism." The Japanese, on the other hand, substitute *r* for *l*.

M

SIX thousand years ago our letter M was an owl, and to this day you can see the owl's horns in those two peaks, yes, and the beak between them, right where it is in the real owl. It must have taken considerable time to draw the owl as it appeared in Egyptian picture-writing and so a very much simplified form was developed by the Egyptian scribes who wrote on papyrus. The early Phoenicians, carving on stone, naturally gave the letter a more angular character It is easy to see how this developed into the symmetrical Greek and Roman M which we use. In sound *m* is called a labial nasal. It is made by sending the breath through the nose while the lips are closed and the vocal chords are vibrating.

N

THE series of little waves which formed the Egyptian sign called the "water line" ~~~ was the ancestor of our letter N. When written in running hand, the undulations tended to disappear and the character assumed the form ⌒ which looked more like a fish. The Phoenicians and Hebrews called it *Nun*, the word for "fish" in their language, but they still further modified it 𓆑 so that we might be inclined to say it looked more like a fish-hook than a fish. So it passed to the early Greeks and Latins, who, straightening the lines and making them of more even length, evolved the letter N. As M is a labial or "lip" nasal, so N is a dental or "tooth" nasal. The sound is made by bringing the end of the tongue in contact with the upper teeth or gums and sending the breath through the nose while the vocal chords are vibrating.

O

AS far back as we can trace the letter O, it has undergone slight change. Its first appearance seems to be in the Phoenician alphabet as a slightly irregular circle. It was supposed to represent an eye and was called *Ayin*, the Phoenician word for "eye." In the Greek alphabet, as we now have it, there are two characters for this letter, great O (*Omega*, Ω) and little O (*Omicron*, Ο), but originally there was only one. Such departures from the perfect circle as we find in ancient inscriptions were due to the difficulty of inscribing a circle in stone. Thus sometimes its form is that of an ellipse, sometimes it is square, and sometimes it is nearly a diamond.

P

ONE of the Egyptian hieroglyphs was a shutter This developed into the character which was borrowed by the Phoenicians. They called it *Pe*, "mouth," perhaps because they thought it looked like a mouth with teeth. When they themselves wrote it, they simplified it so that it is hard to see the resemblance to a mouth but they still kept the name. The Greeks used the same form but turned the hook to the right. They afterwards squared the top thus and finally made the two legs of equal length, in the character which became the modern Greek letter *Pi*. The Romans adopted the rounded form which they curved more and more until finally the semicircle was closed exactly as in our letter P. The name, you will note, has changed very little, and the same is true of the sound, which is formed by closing the lips for an instant, then allowing the breath to escape through them explosively.

Q

THE Egyptian picture sign ⊿ from which our Q is descended represents either an angle or a knee, which of course forms an angle when bent. In the Egyptian script this sign takes a form which begins to look a little like our Q. The Phoenicians formed it like this Ϙ and named it *Qoph*. Scholars disagree as to just what this word means. Some say it means "ape" and that the character represents an ape with its tail hanging down. Another theory is that it represents an aperture of some kind, the eye of a needle, perhaps. Others think it is the picture of an ear, and still others, that of a knot. As pronounced by the Phoenicians and Hebrews, it was a very strong sound that did not need the help of any other letter. Its name and sound were similar to that of *Kaph* (the Phoenician K), but it was sounded farther back in the throat. We do not find the letter Q in the classic or modern Greek alphabet, for, although it once had a place there, it was dropped (except as a numeral) at a very early date. But the Romans kept it and gave it its present form. They used the letter, as we do, with *u*, the combination *qu* having the sound of *kw*. In French *qu* generally stands for the *k* sound, as in *coquette*.

R

OUR letter R is generally traced back to the old Egyptian hieroglyph representing a mouth. Written in a running hand (the so-called hieratic form) it became The Phoenicians, writing on stone, gave it a more angular form and called it *Resh*, meaning "head," from its fancied resemblance to the head supported by the neck. The Greeks faced it about and then later rounded it so that it looked just like our P. We should have had two letters with exactly the same form, had they not added a little tail, which made the letter R as we have it today. The Romans kept this form, but the Greeks, who had developed the form Π for P, dropped the tail again, so their letter R (*Rho*) is still written P. No other consonant shows so many variations in pronunciation as the letter R. In France and Germany it is trilled. In England and America it varies greatly according to the locality. Thus in the eastern and southern parts of the United States, when no vowel sound follows it, as in *care, tire, four*, it is either not pronounced at all, or pronounced as a slight consonant, or converted into an obscure vowel. Of the close relationship between L and R, we have already spoken in the story of L.

S

THERE was a time when the letter S looked more like our W. Turn the W on end and cut off the bottom line and you will get something that looks very much like our S. The story of S begins, in Egyptian picture writing, with the hieroglyph 𓈖 known as the "inundated garden," representing papyrus or lotus plants growing out of the water. When it came to be written in the Egyptian running hand like this it no longer looked like a garden, and the Phoenicians called it *Shin*, which means "teeth." If you look closely, you can see the outline of the lower teeth, and the chin and beard, as well. But as the Phoenicians themselves made it it was like a very squatty W. Then the Greeks took it and standing it on end made it into their letter **Σ** (*Sigma*). Later the last stroke was omitted, and then when the Romans had rounded the points it was our letter S.

T

THE original form of T in the Egyptian hieroglyphics is the picture of a noose or a lasso, or, as some scholars think, that of a tongue. The Phoenicians made it in the form of a cross X + with the four arms of equal length. They and the Hebrews used it as a sign for marking the ownership of animals and for other identification purposes. It is this kind of mark that is probably referred to in Ezekiel ix, 4. The early Greeks moved the horizontal to the top and so made the T we have today. If you examine the small form of the letter as we have it in our printed books today, you will notice a little dark spot in the upper left angle. This spot has a curious origin. It shows that as originally written in the old manuscripts, the T was not crossed after the vertical had been formed, but the horizontal bar was made first (from right to left) and the vertical stroke added without taking the pen off the paper. This, you see, would tend to make a little blot in the place where we have it today. Try it with a pen.

U

YOU have learned that C and G, like I and J, were originally only variations of the same letter, but would you guess that the letters U, V, W, Y were all descended, like F, from the Phoenician *Wau* or *Vau*, which had once been the horned asp of Egypt? (See the story of F). In Latin for a long time the forms V and U were used without distinction. But in the course of time the form V came to be used by preference at the beginning of a word and the form U elsewhere. As the consonant sound more commonly occurred at the beginning, the form V finally came to denote the consonant and the form U to represent the vowel.

V

YOU must have noticed how often on inscriptions in stone, on memorial tablets and public buildings, U is made in the shape of a V. This gives the inscription an air of antiquity, for the U was originally made in that way on Greek and Roman inscriptions, since it was easier to cut with the chisel. The story of how the two letters V and U developed is told under U. The characters V and U were used for the same sound in Latin, Norman-French, and English as late as the Elizabethan period and they were counted as one in alphabetic arrangements. V was commonly called "single U" as W was "double U" as late as the beginning of the 17th century. The sound of *v* in Latin was like our *w*. Our *v* sound seems to have been wanting in Greek and Latin.

W

THE twenty-third letter of the English alphabet is formed of two V's, but we call it "double u." The stories of U and V help you to see why this is so. The letter was originally written UU or VV in the days when U and V were forms of the same letter. But in this case the VV form, which became W when the letters were crossed, was the one that survived. In sound, however, it has remained the same, having the consonant value of *u*. It is uttered with the lips in position for *u* (*oo* of *pool*) but without the resonance of a full-fledged vowel. It has been suggested that it should have been called "half u" instead of "double u."

SOME OF THE GREAT WARS OF HISTORY

American Revolution (1775–83): Successful revolt of the Thirteen English Colonies in America against Brit. rule; Bunker Hill, Saratoga, Yorktown; independence recognized by Great Britain.

Austrian Succession (1741–48): Concerted action of continental powers to appropriate desirable pieces of Hapsburg lands from Maria Theresa, whose cause was championed by Gt. Brit.; war ended with mutual restoration of conquests, except Silesia, which was retained by Prussia.

Austro-Prussian (1866): "Seven Weeks' War," arising out of differences over Schleswig-Holstein question; resulted in overwhelming defeat of Austria at Sadowa, and subsequent exclusion from Ger. federation.

Balkan Wars (1912–13): Attempt of Balkan allies to expel Turkey from Europe; remarkable successes were minimized by subsequent quarrels between allies over newly won territory, enabling Turkey to retain her hold on Constantinople and surrounding territory.

Boer War (1899–1902): Spirited, but futile resistance of Boer settlers in S. Africa to extension of Brit. claims; Transvaal and Orange Free State made Brit. colonies.

Chinese-Japanese War (1894–95): Occasioned by rival pretensions in Korea; a complete victory of Japan's modern military machine over China's antiquated forces; Japan forced by European powers to restore all conquests except Formosa.

Civil War in England (1642–49): Struggle between the Crown and Puritan Parliament over distribution of ecclesiastical and civil jurisdiction; Marston Moor and Naseby; execution of Charles I and establishment of commonwealth.

Civil War in the United States (1861–65): Between Union government and Southern Confederacy over latter's attempt to secede from Union; Vicksburg, Gettysburg; Union preserved.

Crimean (1854–56): Undertaken by Gt. Brit. with aid of other powers in defense of Turkey against Rus. aggressions; siege of Sebastopol; Turkey left intact.

Crusades (1096–1291): Romantic military expeditions of western princes and prelates to recover Holy Sepulchre from Saracens; capture of Antioch, Jerusalem, and Acre; later Crusades were diverted to other ends and Holy Land lapsed into Mohammedan control.

Dutch Independence (1568–1648): Led by William of Orange; Dutch threw off oppressive Span. rule and established independent government; siege of Leyden.

Franco-Prussian (1870–71): Clash between Prussia's imperialistic aspirations and the jealousy of Napoleon III, resulting in humiliating defeat of France, downfall of the Second Empire, and proclamation of German Empire; Sedan, siege of Paris.

French Revolution (1792–99): Great Britain headed coalition of Prussia, Austria, and other countries against France in contest that was last phase of long wars between England and France for colonial and maritime supremacy and also clash between two political systems; Valmy, Ital. campaign; peace made with all allies except England; Egypt. expedition.

Great Northern (1700–21): Undertaken by Russia aided by Denmark and Poland to secure Baltic port at expense of Sweden; siege of Narva, Poltava; Russia secured provinces about Gulf of Finland and Sweden sank to second-rate power.

Greek Independence (1821–29): Greeks threw off Turkish yoke and revived national independence.

Hundred Years' (1337–1453): Series of conflicts between rulers of France and England over disputed titles to Fr. throne and territories; Crécy, Poitiers, Agincourt, Orléans; England lost Fr. possessions except Calais; Fr. monarchy firmly established.

Mexican (1846–48): Arose from annexation by the United States of former Mexican territory of Texas and ensuing boundary disputes; resulted in complete Amer. victory, establishment of the Rio Grande as the boundary, and cession of upper California and New Mexico to United States.

Napoleonic (1799–1815): Determined resistance of Allied European powers to aggressions of Napoleon, ending in his downfall; Austerlitz, Leipzig, Trafalgar, Waterloo.

Peloponnesian (431–404 B.C.): Between rival states of Athens and Sparta for economic and political control of Greece; Athenian expedition to Syracuse, Aegospotami; Athenian supremacy ended.

Persian (493–479 B.C.): Expeditions of Persian emperors against Greece to punish Athens for aiding revolting Persian colonies in Asia Minor, and to extend empire; Marathon, Thermopylae Salamis, Plataea; Greece maintained independence and control of Aegean.

Punic Wars (264–241, 218–202, 149–146 B.C.): Death struggle of Rome and Carthage for domination of Mediterranean world; Hannibal's invasion of Italy, Cannae, Zama, Metaurus; Carthage taken and destroyed.

Russo-Japanese (1904–05): Blow dealt by Japan to Rus. aggression in Far East; siege of Port Arthur, battle of the Sea of Japan; Japanese interests in Korea recognized as paramount, and Japan established as a first-rate power.

Russo-Turkish (1877–8): Arose indirectly from complicated Balkan situation, and directly from Mohammedan uprising against Balkan Christians; fall of Plevna; power of Turkey in Europe practically destroyed, only to be resuscitated by Congress of Berlin.

Seven Years' (1756–63): Resulted from alliance formed against rapidly expanding Prussia by Austria, Russia, France, and other powers; Gt. Brit. allied with Prussia; Rossbach, Leuthen, Quebec; Prussia established as great nation, and foundation of Brit. Empire laid.

Spanish-American (1898–99): Outcome of American sympathy for Cuban revolutionists; established Cuban independence and practically ended Spain's colonial empire, remnants of which were ceded to U.S.; Manila Bay and Santiago.

Spanish Succession (1701–14): Attempt of England, Austria, and allies to prevent establishment of a French prince on Span. throne; Blenheim; Bourbon House established in Spain, but Austria and England gained extensive Fr. and Span. possessions.

Thirty Years' (1618–48): Struggle between Catholics and Protestants of Germany in which Gustavus Adolphus of Sweden played a brilliant part; Leipzig, Lützen; religious and territorial differences settled at price of utter devastation of Germany.

Trojan (c. 1100 B.C.): Waged by Gk. princes against King Priam to avenge abduction of Helen, wife of Menelaus of Sparta (myth.); siege and fall of Troy.

Wars of Alexander the Great (334–323 B.C.): Persian Empire completely overthrown in battles of Granicus, Issus, and Arbela; conquest of Syria, Palestine, and Egypt; invasion of Media.

Wars of the Roses (1455–85): Waged by Houses of Lancaster and York, rival claimants to Eng. throne, until royal marriage united the two lines; Bosworth Field.

War of 1812 (1812–14): Between United States and Great Britain, caused by Great Britain's claims to right of search of Amer. vessels on high seas and impressment of seamen; treaty adjusted boundaries, etc., leaving main cause of war unmentioned.

World War (1914–18): A world-wide struggle between Central Powers and Allied and Associated Powers, arising indirectly from clash between two rival systems of commercial imperialism, and directly from diplomatic tangle following murder of Archduke of Austria by a Serb; Central Powers crushed.

X

OUR letter X got into the alphabet by starting as a chair back. That is what the sign 𓊃 represented in the picture writing of the Egyptians. In the hieratic writing it became 𓋴 and the Phoenicians added some more horizontal bars and made it 𐤎 (*Samekh*), out of which grew the Greek Ξ The Greeks also developed another form Χ which passed to the Romans and from them to us. Just how this form grew out of 𐤎 is not quite clear, but it is thought that *Samekh* was sometimes written ⊞ and that from this two characters developed: one Ξ by removing the vertical lines, and the other ✝ by removing the enclosing square. Then the latter was tilted over and became X. In classic Greek the character Χ came to be used for the letter *Chi* (sounded *kh*), while the Ξ was used for the *ks* sound. In English we pronounce X *ks*, as in *extra*, when the accent precedes, and *gz*, as in *exact*, when the accent follows. At the beginning of a word, as in *Xanthus*, it is pronounced like *z*.

Y

THE twenty-fifth letter of the alphabet is one of the four letters (U, V, W, Y) which have developed out of the Greek *Upsilon* Y And these are all related to the letter F, being derived from the Egyptian hieroglyphic picture of the horned asp The two horns and the body of the asp appear even better in Y than in the letter F. (Read the story of F.) In the Middle English period Y was a favorite with penmen on account of its final flourish, and they frequently used it in place of a final I. That is why today we write "city," "fairy," and "kindly," but where Y is not terminal use I, as in "cities," "fairies," "kindliest." In old English books Y often represents the *th* sound, as in "ye" for "the," because of its resemblance in form to the Anglo-Saxon character Þ which had the sound of *th*. The printers did not have this character and so replaced it sometimes by *th* and sometimes by *y*.

Z

OUR Z comes from the Greek Ζ (*Zeta*). Originally in Egyptian picture writing it represented a duck. Written in a running hand (the "hieratic" form), it became the symbol and then in the Phoenician and early Greek alphabets came to look more like the letter I crushed down . As the letter became more crushed the vertical became diagonal and finally slipped at top and bottom so as to join the horizontals as in the Z today. Among the Phoenicians it was the 7th letter and so remained in the Greek and early Latin alphabets, but it was dropped from the Latin in the third century B.C. Later when the study of Greek became a mark of culture among the Romans, it was restored, but it had lost its place in the alphabet and had to fall in at the tail of the procession, where it still remains.
